The Ivanpah solar thermal power system will use BrightSource’s proven solar tower technology to produce clean, reliable solar electricity to more than 140,000 homes. Located in Ivanpah Dry Lake, California, the three-unit power system will be built on approx. 3,500 acres and will create more than 2,100 jobs for construction workers and support staff.

ECONOMIC BENEFITS

- **Construction Jobs:** More than 2,100 construction workers and support staff at the peak of construction (3 years of construction). BrightSource and its construction partners have a track record for hiring local workers for construction.
- **Employee Wages:** Approx. $650 million* in wages and employee earnings
- **Permanent Operations & Maintenance Jobs:** 86
- **State & Local Tax Benefits:** Approx. $300 million* in local and state taxes

*Preliminary estimates only, based on the power plant’s first 30 years of operation.
TECHNOLOGY

- Ivanpah will produce electricity the same way that most of the world’s electricity is produced – by creating high-temperature steam to turn a conventional turbine. However, instead of burning fossil fuels to create the steam, we use the clean and infinite sun as fuel.
- At the heart of BrightSource’s proprietary power-tower solar thermal system is an innovative solar field design, optimization software and a control system that allow for the creation of high temperature steam.
- At Ivanpah, over 300,000 software-controlled mirrors will track the sun in two dimensions and reflect the sunlight to boilers that sit atop three 459 foot tall towers. When the concentrated sunlight strikes the boilers’ pipes, it heats the water to create superheated steam.
- This high-temperature steam is then piped from the boiler to a standard turbine where electricity is generated. From here, transmission lines carry the power to homes and businesses.

ENVIRONMENTAL BENEFITS

- Efficient Land Use: With its taller towers and optimized solar field design, BrightSource’s solar tower technology uses less land than competing solar technologies, including photovoltaic and trough solar.
- Improves Air Quality: BrightSource’s solar plants avoid millions of metric tons of carbon dioxide (CO\textsubscript{2}) emissions over the plant’s life. A BrightSource plant will have reduced air pollutants, such as nitrogen oxides (NO\textsubscript{x}) and sulfur oxides (SO\textsubscript{x}), than a natural gas-fired power plant.
- Low Water Use: BrightSource’s solar tower technology uses up to 95% less water than competing wet cooled solar thermal plants by employing a dry-cooling process, which uses air instead of water to condense steam. The steam production cycle is a closed-loop system, with all water recycled back into the system, while general conservation measures help to further reduce water usage. The water consumed on the project is for cleaning the mirrors, much like a PV plant of similar size.
- Limited Impact on the Land: Unlike competing technologies, which require the majority of a project site be fully graded, BrightSource solar tower plants retain the majority of the project site’s natural landscape. Instead of extensive grading and concrete foundations, BrightSource’s heliostat pylons are inserted directly in the ground allowing vegetation to co-exist within the solar field below the mirrors. The limited grading and concrete foundations allow the land to retain its natural land contours and features.

Wet CSP/Conventional Cooling vs. BrightSource’s Dry CSP Cooling

PROVEN LEADERSHIP IN SOLAR ENERGY

BrightSource Energy is a leader in the design and development of concentrating solar thermal technology used to produce high-value electricity and steam for power, petroleum and process markets worldwide.
